Abstract

In allusion to data error and equivalence relation for software program design, the paper proposes approximate trace equivalence of real-time linear algebraic transition systems. Firstly, it leads real-time algebraic program into transition system and establishes real-time linear algebraic transition system. And then, it uses matrix norm and matrix singular value decomposition to analyse approximation of traces. Afterwards, it obtains approximate trace equivalence of real-time linear algebraic transition systems. Finally, the traffic light control vehicle flow system example shows that approximate trace equivalence of real-time algebraic transition systems can optimize real-time linear algebraic programs and reduce states.

Keywords: transition system, approximate, trace equivalence, algebraic program

1 Introduction

Early formal model of software programs are mostly discrete model of concurrent systems, such as various process algebra on the language level, computation tree logic on the logical level, automatic machine and transition system on the structural level. They are made up of abstract actions, discrete states and transition relations between states. The discrete method is unable to exchange the data stream. The data stream exchange is one of the most important functions of software programs. It needs to be created algebraic programs which can describe programs data stream exchange. In 2004, Z. Manna et al. defined Hybrid Systems program model with polynomial equations data stream is expressed as states transition labels and opened up a new way of program design and verification based on polynomial algebra [1].

How to define and determine the behaviour equivalence of programs is one of the most important issues in the field of software system design and verification analysis. The same model structure as an equivalent definition is too strictly. A class of functional behaviour of different structure program model may be exactly the same. Therefore, the program models with the same function behaviour are called equivalent. Functional equivalence makes program model be simplified by removing the duplicate branches. Glabbeek proposed fourteen kinds of linear time-branching time equivalence relations [2]. Trace equivalence is a basic state space equivalence relation and it has been widely used in the software system program design and verification analysis. But at present there is no research on trace equivalence of real-time linear algebraic transition systems.

In the software program design and verification analysis, experimental data often have errors. We can only take the approximate value and cannot obtain accurate actual value. Within the error range, we can be treated approximate value as actual value. After the value approximation, it makes some same programs and simplifies the structure of real-time linear algebraic transition system.

From what has been discussion above, firstly, it introduces real-time linear algebraic program to transition system and establishes real-time linear algebraic transition system. Secondly, it uses matrix norm and matrix singular value decomposition to judge whether two real-time linear algebraic transition systems are approximate. Thirdly, it simplifies real-time linear algebraic transition system by trace equivalence theory. Finally, the traffic light control traffic flow system example shows that approximate trace equivalence of real-time linear algebraic transition systems can optimize real-time linear algebraic programs and reduce the states.

2 Real-time linear algebraic transition system

As we know, labelled transition system is a kind of typical model which describes transition relation between states. Many computer system modelling are based on labelled transition system.

COMPUTER MODELLING & NEW TECHNOLOGIES 2014 18(7) 36–40

Definition 1 (Labelled Transition System [3]) A labelled transition system is a tuple \( M = S, L, T, s_0 \), where
1) \( S \) is a finite set of states, \( s \in S \) is a state.
2) \( L \) is a finite set of labels, \( l \in L \) is a label, a label describes an action.
3) \( T \subseteq S \times L \times S \) is a set of transitions.
4) \( s_0 \) is the initial state.

Definition 2 (Transition of Labelled Transition System) A transition of labelled transition system is a tuple \( s_l, s, s' \), where \( s_l \) represents pre-state of the transition and \( s \) represents post-state of the transition.

Definition 3 (Trace [3]) In the transition system, a trace is an action sequence \( l_1 l_2 \cdots l_n \) and satisfies an execution sequence \( \eta_0 = l_1 l_2 \cdots l_n \), \( \text{trace}(\eta) = l_1 l_2 \cdots l_n \).

Definition 4 (Real-Time Linear Algebraic Program) Let \( R \) be the set of real numbers, \( x(i = 1, \ldots, n) \in R \) and \( \chi(i = 1, \ldots, n) \in R \) be variables, \( t \in R \) is a time variable and \( t \geq 0 \). An algebraic program \( X' = X + (AX_0 + b)t \) is a real-time linear algebraic program, where \( X_0 = (x_0, \ldots, x_m)^T \) is the initial state value of real-time linear algebraic transition system, \( X = (x_1, \ldots, x_n)^T \) is the pre-state value of real-time linear algebraic program and \( X' = (x'_1, \ldots, x'_n)^T \) is the post-state value of real-time linear algebraic program. \( A = \begin{pmatrix} a_{11} & a_{12} & \cdots & a_{1n} \\ a_{21} & a_{22} & \cdots & a_{2n} \\ \vdots & \vdots & \ddots & \vdots \\ a_{n1} & a_{n2} & \cdots & a_{nn} \end{pmatrix} \) is the \( n \times n \) matrix and \( A \neq 0 \), \( b = (b_1, b_2, \ldots, b_n)^T \) is the \( n \) dimension column vector. The elements of \( A \) and \( b \) are all real numbers.

In the real-time linear algebraic program, the value of time variable \( t \) is a fixed real number. \( t \) represents the time from one transition to another state.

Definition 5 (Real-Time Linear Algebraic Transition System) A real-time linear algebraic transition system is a tuple \( M = \langle V, TX, S, P, Q, s_0 \rangle \), where
1) \( V = \{x_0, \ldots, x_m\} \) is a finite set of system variables.
2) \( TX \) is a finite set of system state values. \( X_0 \in TX \) is the initial state value.
3) \( S \) is a finite set of states, \( s \in S \) is a state.
4) \( P \) is a finite set of real-time linear algebraic program, \( p \in P \) is a real-time linear algebraic program.
5) \( Q \subseteq S \times P \times S \) is a finite set of state transitions, \( q \in Q \) is a state transition.
6) \( s_0 \in S \) is the initial state.

3 Approximation of real-time linear algebraic transition systems

In the software program design, matrix elements and vector elements which are in the real-time linear algebraic programs often have errors. Let \( A + \delta A \) be actual matrix, \( A \) be approximate matrix, \( b + \delta b \) be actual vector, \( b \) be approximate vector, \( X' = X + [(A + \delta A)X_0 + (b + \delta b)t] \) be actual real-time linear algebraic program, \( X' = X + (AX_0 + b)t \) be approximate real-time linear algebraic program. In the actual real-time linear algebraic program and corresponding approximate real-time linear algebraic program, time \( t \) is the same. We use matrix norm and matrix singular value decomposition to analyse approximation of real-time linear algebraic transition systems.

Definition 6 (Matrix Singular Value Decomposition) Let \( A = U \Sigma V^T \) be the matrix singular value decomposition, the main diagonal elements \( \sigma_1 \geq \sigma_2 \geq \cdots \geq \sigma_n \geq 0 \) of \( \Sigma \) are called singular value of matrix \( A \), the column vectors \( u_1, u_2, \ldots, u_n \) of matrix \( U \) are eigenvectors of matrix \( AA^T \), \( u_1, u_2, \ldots, u_n \) are left singular vectors of matrix \( A \), \( v_1, v_2, \ldots, v_n \) are right singular vectors of matrix \( A \).

If \( \sigma_{i1} = \cdots = \sigma_{ni} = 0 \), then the matrix \( A \) singular value decomposition is \( A = \sum_{i=1}^{n} \sigma_{pi} v_i^T \).

Let matrix \( A \in \mathbb{R}^{m \times n} \), a norm \( \|A\|_F = \left( \sum_{i=1}^{m} \sum_{j=1}^{n} \left| a_{ij} \right|^2 \right)^{1/2} \) of matrix \( A \) is called Frobenius norm of matrix \( A \). Matrix norm \( \|A\|_F \) and vector norm \( \|v\|_2 \) are inclusive.

Theorem 1. For any matrix \( A \in \mathbb{R}^{m \times n} \), \( r = \min \{m, n\} \), \( \sqrt{\sum_{i=1}^{r} \sigma_i^2} = \|A\|_F \).

Let \( s_0 \) be the initial state, \( p_1p_2 \cdots p_n \) be the trace of actual real-time linear algebraic transition system and it

![Figure 1 An real-time linear algebraic transition system](image.png)
satisfies a finite execute sequence \( \eta = \eta_0 \delta_1 \eta_1 \cdots \eta_k \delta_k \), \( p_0, p_1, \cdots, p_k \) be the trace of approximate real-time linear algebraic transition system and it satisfies a finite execute sequence \( \eta = \eta_0 \delta_1 \eta_1 \cdots \eta_k \delta_k \), \( p_0, p_1, \cdots, p_k \) are actual real-time linear algebraic programs and \( p_1, p_2, \cdots, p_k \) are approximate real-time linear algebraic programs. The actual value of state \( s_j \) is
\[
X_j' = (E + j(tA + \delta A))X_0 + j(t(b + \delta b))
\]
the approximate value of state \( s_j \) is
\[
X_j = (E + jA)X_0 + jtb
\]
The actual value \( X_j' \) can be written as
\[
X_j' = (E + j(tA + \delta A))X_0 + j(t(b + \delta b))
\]
the approximate value \( X_j \) can be written as
\[
X_j = (E + jA)X_0 + jtb
\]
Approximate of actual value \( X_j' \) and approximate value \( X_j \) is equal to approximate of matrix \( (E + j(tA + \delta A)) \) and matrix
\[
B_j = (E + jA)jtb
\]
Let \( 1 \leq j < k \), \( p_j' \) is\(
X' = X + [(A_j + \delta A_j)X_0 + (b_j + \delta b_j)]t_j
\)
and \( p_j \) is\(
X' = X + [A_jX_0 + b_j]t_j
\)
The actual value of state \( s_j' \) is
\[
X'_j = \left[ E + \sum_{i=1}^{j} [(A_i + \delta A_i)t_i] \right]X_0 + \sum_{i=1}^{j} [(b_i + \delta b_i)t_i]
\]
The approximate value of state \( s_j \) is
\[
X_j = \left[ E + \sum_{i=1}^{j} (A_i)t_i \right]X_0 + \sum_{i=1}^{j} (b_i)t_i
\]
The actual value \( X_j' \) can be written as
\[
X_j' = \left[ E + \sum_{i=1}^{j} [(A_i + \delta A_i)t_i] \right]X_0 + \sum_{i=1}^{j} [(b_i + \delta b_i)t_i]
\]
The approximate value \( X_j \) can be written as
\[
X_j = \left[ E + \sum_{i=1}^{j} (A_i)t_i \right]X_0 + \sum_{i=1}^{j} (b_i)t_i
\]
The approximation of actual value \( X_j' \) and approximate value \( X_j \) is equal to approximation of matrix
\[
\left[ E + \sum_{i=1}^{j} [(A_i + \delta A_i)t_i] \right] \left[ \sum_{i=1}^{j} [(b_i + \delta b_i)t_i] \right]
\]
and matrix
\[
\left[ E + \sum_{i=1}^{j} (A_i)t_i \right] \left[ \sum_{i=1}^{j} (b_i)t_i] \right]
\]
\[
\delta B_j + \delta B_j' = \left[ E + \sum_{i=1}^{j} [(A_i + \delta A_i)t_i] \right] \left[ \sum_{i=1}^{j} [(b_i + \delta b_i)t_i] \right]
\]
\[
B_j = \left[ E + \sum_{i=1}^{j} (A_i)t_i \right] \left[ \sum_{i=1}^{j} (b_i)t_i] \right]
\]
The singular value decomposition of matrix \( \delta B_j \) is
\[
\delta B_j = U_j \Sigma_j V_j^T \text{ and } \| \delta B_j \|_F = \sqrt{\sum_{i=1}^{j} \sigma_i^2}
\]
For a given positive number \( \epsilon \), if it holds \( W_j < \epsilon \), then matrix \( B_j + \delta B_j \) and matrix \( B_j \) are approximate. If matrix \( B_j + \delta B_j \) and matrix \( B_j \) are approximate, then actual value \( X_j' \) and approximate value \( X_j \) are approximate, actual real-time linear algebraic program and approximate real-time linear algebraic program are approximate.

Definition 7 (Approximation of Traces) For a given positive number \( \epsilon \), \( \forall j, 1 \leq j \leq k \), if it holds \( W_j < \epsilon \), then actual trace \( p_1'p_2' \cdots p_k' \) and approximate trace \( p_1p_2 \cdots p_k \) are approximate. If there exists \( W_j \geq \epsilon \), then actual trace \( p_1'p_2' \cdots p_k' \) and approximate trace \( p_1p_2 \cdots p_k \) are not approximate.

Definition 8 (Approximation of Real-Time Algebraic Transition Systems) If all traces of two real-time linear algebraic transition systems are approximate, then these two real-time linear algebraic transition systems are approximate.

Approximation of real-time linear algebraic transition systems can optimize real-time linear algebraic programs and reduce bits of matrix elements and vector elements. It can improve computation speed of real-time linear algebraic transition system. For the actual real-time linear algebraic transition system \( RS_1 \), it gets approximate real-time linear algebraic transition system \( RS_2 \) by approximate algorithm.

4 Approximation trace equivalence of real-time linear algebraic transition systems

Definition 9 (Trace Equivalence [2]) If there exists a process \( q \) and \( p \leftarrow q \rightarrow q \), then \( \sigma \in \text{Act} \) is a trace of a process \( p \). Let \( T(p) \) be a set of traces of process \( p \). If \( T(p) = T(q) \), then two processes \( p \) and \( q \) are trace equivalence, it can be written as \( p \approx q \). In trace semantics two processes are identified if they are trace equivalent.

\[\begin{array}{cccc}
& & & \\
& & & \\
& & & \\
& & & \\
s_0 & \approx \tau & s_0 & \\
& \downarrow a & \downarrow a & \\
& s_1 & s_1 & \\
& \downarrow b & \downarrow b & \\
& s_2 & s_2 & \\
& \downarrow c & \downarrow c & \\
& s_3 & s_3 & \\
\end{array} \]

\[abc+ab+a\]

FIGURE 2 A trace trace equivalence example
In the Figure 2, $a$, $b$, $c$ are real-time linear algebraic programs, left real-time linear algebraic transition system has three traces $abc, ab, a$, right real-time linear algebraic transition system has only one trace $abc$. The left system and right system have the same function.

We have the approximate real-time linear algebraic transition system $RS_2$, through trace equivalence theory we obtain approximate trace equivalence system $RS_1$ of actual real-time linear algebraic transition system.

Approximate trace equivalence of real-time linear algebraic transition systems has a very important significance. It can optimize real-time linear algebraic programs and reduce states.

In the Figure 3, $a',b',c'$ are actual real-time linear algebraic programs, $a,b,c$ are approximate real-time linear algebraic programs. The left system has seven states, the right system has four states.

5 Experiments

Assume that vehicles on a section road are divided into two types of motor vehicle and non-motor vehicle. Exit of road has traffic lights. Traffic light basic transformation sequence is yellow→red→blue→yellow.

When the traffic light is yellow, vehicles which are beyond the stop line can forward pass. When the traffic light is red, vehicles are prohibited passage. Let $x_1$ be motor vehicle flow, $x_2$ be non-motor vehicle flow, $X = (x_1, x_2)^T$ be vehicle flow. The initial state value of traffic light control vehicle flow system is $X_0 = (5,5)^T$. Figure 4 is the actual traffic light control vehicle flow system.

In the Figure 5, approximate real-time linear algebraic program $p_1$ is $X' = X + \begin{bmatrix} 2.01 \\ 2.01 \end{bmatrix} X_0 + \begin{bmatrix} 1.01 \\ 1.01 \end{bmatrix} \times 2$ , $p_2$ is $X' = X + \begin{bmatrix} 4.02 \\ 4.02 \end{bmatrix} X_0 + \begin{bmatrix} 2.02 \\ 2.02 \end{bmatrix} \times 10$ , $p_3$ is $X' = X + \begin{bmatrix} -4.02 \\ -4.02 \end{bmatrix} X_0 + \begin{bmatrix} -2.02 \\ -2.02 \end{bmatrix} \times 11$ , $p_4$ is $X' = X + \begin{bmatrix} 1.99 \\ 1.99 \end{bmatrix} X_0 + \begin{bmatrix} 0.99 \\ 0.99 \end{bmatrix} \times 2$ , $p_5$ is $X' = X + \begin{bmatrix} 3.98 \\ 3.98 \end{bmatrix} X_0 + \begin{bmatrix} 1.99 \\ 1.99 \end{bmatrix} \times 10$. 

In the Figure 4, actual real-time linear algebraic program $p_1'$ is $X' = X + \begin{bmatrix} 2.01 \\ 2.01 \end{bmatrix} X_0 + \begin{bmatrix} 1.01 \\ 1.01 \end{bmatrix} \times 2$ , $p_2'$ is $X' = X + \begin{bmatrix} 4.02 \\ 4.02 \end{bmatrix} X_0 + \begin{bmatrix} 2.02 \\ 2.02 \end{bmatrix} \times 10$ , $p_3'$ is $X' = X + \begin{bmatrix} -4.02 \\ -4.02 \end{bmatrix} X_0 + \begin{bmatrix} -2.02 \\ -2.02 \end{bmatrix} \times 11$ , $p_4'$ is $X' = X + \begin{bmatrix} 1.99 \\ 1.99 \end{bmatrix} X_0 + \begin{bmatrix} 0.99 \\ 0.99 \end{bmatrix} \times 2$ , $p_5'$ is $X' = X + \begin{bmatrix} 3.98 \\ 3.98 \end{bmatrix} X_0 + \begin{bmatrix} 1.99 \\ 1.99 \end{bmatrix} \times 10$. 

5 Experiments

Assume that vehicles on a section road are divided into two types of motor vehicle and non-motor vehicle. Exit of road has traffic lights. Traffic light basic transformation sequence is yellow→red→blue→yellow.

When the traffic light is yellow, vehicles which are beyond the stop line can forward pass. When the traffic light is red, vehicles are prohibited passage. Let $x_1$ be motor vehicle flow, $x_2$ be non-motor vehicle flow, $X = (x_1, x_2)^T$ be vehicle flow. The initial state value of traffic light control vehicle flow system is $X_0 = (5,5)^T$. Figure 4 is the actual traffic light control vehicle flow system.

FIGURE 3 An approximate trace equivalence of real-time linear algebraic transition systems example

FIGURE 4 Actual traffic light control vehicle flow system

FIGURE 5 Approximate traffic light control vehicle flow system
For a given positive number $\varepsilon<1$, it uses formula
\[ \|B_j + \delta B_j - B_j\| = \|\delta B_j\| = \sqrt{\sum_{i=1}^{n} \sigma_{i,j}^2} = W_j \]
to obtain
\[ \|\delta B\|_{\text{max}} = 0.44 < \varepsilon . \]
Because the corresponding traces of $R_{S_1}$ and $R_{S_2}$ are approximate, actual traffic light control vehicle flow system $R_{S_1}$ and approximate traffic light control vehicle flow system $R_{S_2}$ are approximate.

Through the trace equivalence theory, we get the approximate trace equivalence system $R_{S_1}$.

\[ R_{S_1} \]

\[ s_0 \]

\[ p_3 \]

\[ s_2 \]

\[ p_1 \]

\[ s_1 \]

\[ (p_1 p_2 p_3)^* \]

FIGURE 6 Approximate trace equivalence system

Form what has been discussion above, approximate trace equivalence of traffic light control vehicle flow systems can optimize real-time linear algebraic programs and reduce system states.

### 6 Conclusion

In this paper, the approximate trace equivalence of real-time linear algebraic transition system is proposed. It can optimize real-time linear algebraic programs and reduce system states. In the future work, we will use approximate trace equivalence of real-time linear algebraic transition systems to study approximate trace equivalence of real-time linear algebraic Hybrid Systems.
